Or Make It

The data layer isn't fixed. It's extensible.

Biodiversity isn't in the Northwood questionnaires. Neither is water use. That's not a blocker — it's an invitation. Prompt Claude Code to generate sector-plausible baselines for the portico in question. Then iterate until the data earns its place in the analysis.

01 — SEED
Sector-reasonable baseline
Facility geography, published benchmarks, industry ranges. Ask for a starting point, not a final number.

02 — REFINE
Iterate in dialogue
Challenge outliers. Add the contradictions real data has. Cross-check against sources. Make it earn your trust.

03 — DOCUMENT
Mark and hand off
Simulated, with assumptions noted. Now it's addressable like any other dataset — and feeds the model.

Kith Climate Course Page 1

This Week, Claude Code Writes Python

The same tool, in a new register

Python

You don't write code. Claude Code does.

01 You prompt the business question 02 CC writes and runs the model 03 Output lands in HTML

What a "Model" Looks Like This Week

Four examples. All runnable by Friday.

CBAM Exposure

Sterling Precision exports to the EU. Apply embodied-carbon estimates and 2026/2030 CBAM rates. Output: \$/yr exposure today and under a 2030 scenario.

Inputs: carbon (Week 3), export mix (Supabase), CBAM rates (reference)

Insurance Avoided

Harvest Ridge Foods sits in a flood zone. Model insurance premium trajectory with and without mitigation capex. Output: NPV of mitigation over hold period.

Inputs: facility geography, FEMA data, insurance industry trend

Retrofit NPV

LED and HVAC retrofits across Northwood facilities. Standard capex-to-savings calculation. Output: payback and NPV per portco, ranked.

Inputs: facility energy, utility rates, retrofit cost benchmarks

Exit Multiple Sensitivity

Keystone is carbon-intensive for a behavioral health network. Model premium-buyer screening. Output: multiple haircut scenarios at exit.

Inputs: intensity metrics, comps (Supabase), buyer ESG criteria

The Materiality Matrix

Output, not input.

What this is

Every ESG issue for a portco — transition risk, physical risk, water, labor, governance — plotted on the same grid.

The upper-right is where your time goes. Everything else can wait, or belongs in a different bucket entirely.

The matrix is an output of the model, not an input to it. CC places the points.

What Sarah Sees

One page. Ranked by dollars. This is the deliverable.

PORTCO	TOP MATERIAL ISSUE	\$ EXPOSURE / YR	TOP INITIATIVE	PAYBACK
Sterling Precision	CBAM transition risk	\$180k	Process heat electrification	4.2 yr
Harvest Ridge Foods	Water stress (simulated)	\$95k	Drip irrigation retrofit	2.8 yr
Keystone Behavioral Health	Insurance premium trajectory	\$68k	Flood mitigation capex	3.5 yr
Trident IT Solutions	Data center cooling cost	\$62k	Cold-aisle retrofit	2.3 yr
Patriot Staffing	Commute cost & Scope 3	\$42k	EV fleet pilot	5.1 yr

Bonus: Push to the Ceiling

"Initiatives Consulting," taken as far as Claude Code will go

If you finish the five deliverables and want to see what the ceiling looks like — point CC at a single portco and ask it for the full capex plan a PE sponsor would actually act on. **Not a list of ideas. A sequenced, exit-linked program.**

- A catalog of initiatives, each traced to a source in the workspace
- An EBITDA bridge + exit multiple sensitivity
- Board, LP, customer, and CIM disclosure surfaces

- A sequenced 2026–2028 roadmap with trigger events overlaid
- A risk register with owners and mitigations
- An IC one-pager the deal team could take in

The old version: \$250K, 4–6 months, once.

The CC version: ~\$0, ~2 days, regenerated on every data update.
